

Mobile Device Control

Our tool set includes a full device and application administration console, to effectively control and monitor all connected devices.

Once an organization adopts a mobile strategy, some of the first questions that they will ask are:

How will we manage the devices?

How secure is our corporate data on those devices?

How do we ensure that users only get the applications and data required for the task?

If an employee loses a device, can the corporate data be wiped?

Where are the devices physically located?

1

Safety comes first

Play a bigger part in keeping people safe with TOKN. By geo-tagging and recording device status information, you can better control the risk of employees working in remote or potentially hazardous locations and have more control.

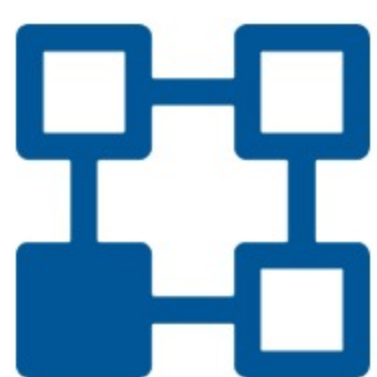

2

Secure your data

Locate and remote wipe or black list devices. If a device is lost or stolen, the corporate data and apps are secure.

3

Full audit history

All communication between connected mobile devices is logged. This enables all activity to be traced in the system. This includes all consumption data which can later be reconciled with telecommunication service providers.
